List of axioms and axiom systems

Convention: In this list the axiom systems (i.e. theories) to be recalled will be boxed in. The only purpose of this is to make searching in the list easier.

(1) Main axiom systems

\[ \text{Basax} \stackrel{\text{def}}{=} \{ \text{Ax1}, \text{Ax2}, \text{Ax3}, \text{Ax4}, \text{Ax5}, \text{Ax6}, \text{AxE} \} \] (cf. p.51), where:

\text{Ax1} \quad G = \text{Eucl}(n, F), \text{p.45}.

\text{Ax2} \quad \text{Obs} \cup \text{Ph} \subseteq \text{Ib}, \text{p.48}.

\text{Ax3} \quad (\forall h \in \text{Ib})(\forall m \in \text{Obs}) \text{tr}_m(h) \in G, \text{p.48}.

\text{Ax4} \quad (\forall m \in \text{Obs}) \text{tr}_m(m) = \tilde{t}, \text{p.48}.

\text{Ax5} \quad (\forall m \in \text{Obs})(\forall \ell \in G) \left( \text{ang}^2(\ell) < 1 \Rightarrow (\exists k \in \text{Obs}) \ell = \text{tr}_m(k) \right) \text{ and}

\text{ang}^2(\ell) = 1 \Rightarrow (\exists ph \in \text{Ph}) \ell = \text{tr}_m(ph) \right), \text{p.50}.

\text{Ax6} \quad (\forall m, k \in \text{Obs}) \text{Rng}(w_m) = \text{Rng}(w_k), \text{p.50}.

\text{AxE} \quad (\forall m \in \text{Obs})(\forall ph \in \text{Ph}) v_m(ph) = 1, \text{p.51}.

\[ \text{Newbasax} \stackrel{\text{def}}{=} (\text{Basax} \setminus \{ \text{Ax6}, \text{Ax3}, \text{AxE} \}) \cup \{ \text{Ax6}_0, \text{Ax6}_1, \text{Ax3}_0, \text{AxE}_0 \} = \{ \text{Ax1}, \text{Ax2}, \text{Ax3}_0, \text{Ax4}, \text{Ax5}, \text{Ax6}_0, \text{Ax6}_1, \text{AxE}_0 \} \] (cf. p.191), where:

\text{Ax6}_0 \quad (\forall m, k \in \text{Obs}) w_m[\text{tr}_m(k)] \subseteq \text{Rng}(w_k), \text{p.190}.

Intuitively, observer \( k \) sees all those events which are seen by another observer \( m \) on \( k \)'s life-line.

\text{Ax6}_1 \quad (\forall m, k \in \text{Obs}) \text{Dom}(t_{mk}) \in \text{Open}, \text{p.190}.

\text{Ax3}_0 \quad (\forall h \in \text{Ib}) (\text{tr}_m(h) \in G \cup \{ \emptyset \}) \land (\exists k \in \text{Obs})\text{tr}_k(h) \neq \emptyset, \text{p.191}.

\text{AxE}_0 \quad (\forall m \in \text{Obs})(\forall ph \in \text{Ph})(\text{tr}_m(ph) \neq \emptyset \Rightarrow v_m(ph) = 1), \text{p.191}.
\[\text{Bax} \overset{\text{def}}{=} \text{(Newbasax} \setminus \{ \text{Ax}5, \text{Ax}\text{E}_0 \}) \cup \{ \text{Ax}5^{\text{Obs}}, \text{Ax}5^{\text{Ph}}, \text{Ax}\text{E}_{00}, \text{Ax}\text{E}_{01} \} = \{ \text{Ax}1, \text{Ax}2, \text{Ax}3_0, \text{Ax}4, \text{Ax}5^{\text{Obs}}, \text{Ax}5^{\text{Ph}}, \text{Ax}6_{00}, \text{Ax}6_{01}, \text{Ax}\text{E}_{00}, \text{Ax}\text{E}_{01} \} \] (cf. p.219), where:

\[
\begin{align*}
\text{Ax}5^{\text{Obs}} & \quad (\exists ph)(\forall \ell) \left( m \overset{\circ}{\rightarrow} ph \land [\text{ang}^2(\ell) < v_m(ph) \Rightarrow (\exists k) \ell = tr_m(k)] \right), \text{p.218} \\
\text{Ax}5^{\text{Ph}} & \quad \text{ang}^2(\ell) = v_m(ph) \Rightarrow (\exists ph) \ell = tr_m(ph), \text{p.219}.
\end{align*}
\]

\[
\begin{align*}
\text{Ax}\text{E}_{00} & \quad (m \overset{\circ}{\rightarrow} ph_1, ph_2) \Rightarrow v_m(ph_1) = v_m(ph_2), \text{p.218}.
\end{align*}
\]

\[
\begin{align*}
\text{Ax}\text{E}_{01} & \quad v_m(ph) \neq 0, \text{p.218}.
\end{align*}
\]

\[\text{Flxbasax} \overset{\text{def}}{=} \text{Bax} + \text{Ax}\text{E}_{02} = \{ \text{Ax}1, \text{Ax}2, \text{Ax}3_0, \text{Ax}4, \text{Ax}5^{\text{Obs}}, \text{Ax}5^{\text{Ph}}, \text{Ax}6_{00}, \text{Ax}6_{01}, \text{Ax}\text{E}_{00}, \text{Ax}\text{E}_{01}, \text{Ax}\text{E}_{02} \} \] (cf. p.428), where:

\[
\begin{align*}
\text{Ax}\text{E}_{02} & \quad (\forall m, k \in \text{Obs})(\forall ph, ph_1 \in \text{Ph}) \\
& \quad (m \overset{\circ}{\rightarrow} ph \land k \overset{\circ}{\rightarrow} ph_1) \Rightarrow v_m(ph) = v_k(ph_1), \text{p.427}.
\end{align*}
\]

\[\text{Bax}^- \overset{\text{def}}{=} (\text{Bax} \setminus \{ \text{Ax}5^{\text{Obs}}, \text{Ax}5^{\text{Ph}}, \text{Ax}\text{E}_{00} \}) \cup \{ \text{Ax}5_{\text{Obs}}, \text{Ax}5_{\text{Ph}}, \text{Ax}\text{P}1 \} = \{ \text{Ax}1, \text{Ax}2, \text{Ax}3_0, \text{Ax}4, \text{Ax}5_{\text{Obs}}, \text{Ax}5_{\text{Ph}}, \text{Ax}6_{00}, \text{Ax}6_{01}, \text{Ax}\text{P}1, \text{Ax}\text{E}_{01} \} \] (cf. p.479), where:

\[\text{Ax}\text{P}1\] Intuitively, starting out from one point \( p \) of space-time, in every direction (forwards) there is at most one “speed of light” (i.e. photon-trace), formally:

\[
(\forall m \in \text{Obs})(\forall ph_1, ph_2 \in \text{Ph})(\forall d \in \text{directions})^{1298} \left( (ph_1 \text{ and } ph_2 \text{ are moving forwards in direction } d \text{ as seen by } m \text{ and } tr_m(ph_1) \cap tr_m(ph_2) \neq \emptyset) \Rightarrow \right.
\]

\[
tr_m(ph_1) = tr_m(ph_2), \text{p.472}.
\]

\[\text{Ax}5^{\text{Ph}}\] Intuitively, from any point \( p \) of space-time in any direction there is a photon moving forwards in that direction, cf. Fig.138 (p.477), formally:

\[
(\forall m \in \text{Obs})(\forall p \in nF)(\forall d \in \text{directions})(\exists ph \in \text{Ph}) \\
\left[ p \in tr_m(ph) \land (ph \text{ is moving forwards in direction } d \text{ as seen by } m) \right], \text{p.477}.
\]

\[^{1298}\text{Let us recall that directions are (nonzero) space-vectors, i.e. directions} = n^{-1}F \setminus \{0\}, \text{cf. p.470.}\]
**Ax5\textsubscript{Obs}** Intuitively: Let us fix an observer \( m \), a direction \( d \), and a point \( p \) of spacetime. We will speak about things moving forwards in direction \( d \) through point \( p \) as seen by \( m \) (without mentioning all this data). Assume there is a photon moving in direction \( d \). Then there is a photon in the same direction which is limiting in the following sense: For all speeds slower than this limiting photon, there is an observer moving with this speed, cf. Fig.139 (p.478). Formally:

\[
(\forall m \in \text{Obs})(\forall p \in \mathbb{n}F)(\forall d \in \text{directions})
\]
\[
\left( \left( \exists ph \in \text{Ph} \right) \left( p \in \text{tr}_m(ph) \right) \land \left( ph \text{ is moving forwards in } d \text{ as seen by } m \right) \right) \Rightarrow
\]
\[
\left( \left( \exists ph \in \text{Ph} \right) \left( p \in \text{tr}_m(ph) \right) \land \left( ph \text{ is moving forwards in } d \text{ as seen by } m \right) \right) \land
\]
\[
\left( \forall \lambda \in F \right) \left( 0 \leq \lambda < v_m(ph) \Rightarrow \left( \exists k \in \text{Obs} \right) \left( p \in \text{tr}_m(k) \land v_m(k) = \lambda \land \right) \right)
\]
\[
(k \text{ is moving forwards in direction } d \text{ as seen by } m)) \right]\] , p.477.

**Pax** \( \overset{\text{def}}{=} \{ \text{Ax1, Ax2, Ax3}_0, \text{Ax4, Ax5}_\text{Obs}^{--}, \text{Ax6}_0, \text{Ax6}_1 \} \) (cf. p.482) where:

**Ax1, Ax2, Ax3\(_0\), Ax4, Ax6\(_0\), Ax6\(_1\)** have already been listed.

**Ax5\textsubscript{Obs}^{--}** Intuitively, for each direction \( d \) there is a positive \( \lambda \) such that through any point there are observers moving forwards in direction \( d \) with all speeds smaller than \( \lambda \). More precisely, for any observer \( m \) and for any plane \( P \) parallel with \( \ell \) there is \( \lambda \in \mathbb{+}F \) such that for any straight line \( \ell \) in \( P \), with \( \text{ang}^2(\ell) < \lambda \), \( \ell \) is the trace of an observer (as seen by \( m \), of course). In other words:

\[
(\forall m \in \text{Obs})(\forall d \in \text{directions})(\forall p \in \mathbb{n}F)(\exists \lambda \in \mathbb{+}F)
\]
\[
(\forall q \in \mathbb{n}F) \left[ \text{space}(p) - \text{space}(q) = \delta \cdot d \text{ for some } \delta \in F \Rightarrow \left( \forall 0 \leq \varepsilon < \lambda \right) \right.
\]
\[
(\exists k \in \text{Obs})\left( k \text{ moves forwards in direction } d \text{ with speed } \varepsilon \text{ and } q \in \text{tr}_m(k) \right) \],
\]
p.481.

\[\ast \quad \ast \quad \ast\]

Assume **Ax1, Ax2, Ax3\(_0\), AxP1**. Let \( m \in \text{Obs} \). Then

\[
c_m : \mathbb{n}F \times \text{directions} \rightarrow F \cup \{ \infty \}
\]
is a partial function such that \( c_m(p,d) \) is defined iff \( m \) sees a photon at point \( p \) moving forwards in direction \( d \), and \( c_m(p,d) \) is the speed of this photon,\(^{1299}\) cf. pp. 473, 535.

\( ^{1299} \)There is only one such speed because of **AxP1**.
Let $Th$ be one of our theories such that $Th \models \{ Ax1, Ax2, Ax3_0, AxP1 \}$. Then $\boxed{Th^{\oplus}} \overset{\text{def}}{=} Th + c_m(p, d) < \infty$, p.643.

Next, we turn to listing the Reichenbachian versions of our theories. For this we recall some notation.

Assume $Bax^-$. By Thm.4.3.17 (p.488), the speed $c_m(p, d)$ does not depend on $p$. This motivates the following:

$$c_m(d) \overset{\text{def}}{=} c_m(0, d),$$

cf. p.488. Intuitively, $c_m(d)$ is the (square of the) speed of light in direction $d$ as seen by observer $m$.

**Notation:** Let $m \in Obs$ and $d \in \text{directions}$. Then

$$T_m(d) \overset{\text{def}}{=} \begin{cases} 1/\sqrt{c_m(d)} & \text{if } 0 \neq c_m(d) < \infty, \\ \infty & \text{if } c_m(d) = 0, \\ 0 & \text{if } c_m(d) = \infty, \end{cases}$$

cf. p.555. $T_m(d)$ is the reciprocal of the "speed of light", i.e. it is the time needed for a photon to cover the unit distance in direction $d$ (as seen by observer $m$).

$\boxed{\text{Reich}_0(Bax)} \overset{\text{def}}{=} Bax^- + R(AxE_{00})$ (cf. p.562), where

$$R(AxE_{00}) \overset{\text{def}}{=} (\forall d, d_1 \in \text{directions})[T_m(d) + T_m(-d) = T_m(d_1) + T_m(-d_1)],$$

cf. p.557.

$\boxed{\text{Reich}_0(Flxbasax)} \overset{\text{def}}{=} Bax^- + R(AxE_{02})$ (cf. p.562), where

$$R(AxE_{02}) \overset{\text{def}}{=} (\forall m, k \in Obs)(\forall d, d_1 \in \text{directions})$$

$$T_m(d) + T_m(-d) = T_k(d_1) + T_k(-d_1), \text{ and } Ax(\sqrt{-}),$$

cf. p.557.

$\boxed{\text{Reich}_0(Newbasax)} \overset{\text{def}}{=} Bax^- + R(AxE)$ (cf. p.562), where

$$R(AxE) \overset{\text{def}}{=} (\forall m \in Obs)(\forall d \in \text{directions})T_m(d) + T_m(-d) = 2,$$

cf. p.557.

$\boxed{\text{Reich}_0(Basax)} \overset{\text{def}}{=} \text{Reich}_0(\text{Newbasax}) + Ax6$, p.562.

Let $Th \in \{ Bax, Flxbasax, Newbasax, Basax \}$. Then

$\boxed{\text{Reich}(Th)} \overset{\text{def}}{=} \text{Reich}_0(Th) + R_\Delta(E)$ (cf. p.576), where

1256
\[ \mathbf{R}_\triangle(E) \quad (\forall m \in \text{Obs})(\exists r \in F)(\forall d_1, d_2, d_3 \in \text{directions}) \left[ d_1 + d_2 + d_3 = 0 \Rightarrow \frac{|d_1| \cdot T_m(d_1) + |d_2| \cdot T_m(d_2) + |d_3| \cdot T_m(d_3)}{|d_1| + |d_2| + |d_3|} = r \right], \text{ p.574.} \]

(2) **Axioms concerning the direction of flow of time**

The binary relation \( \uparrow \subseteq \text{Obs} \times \text{Obs} \) is defined as follows.

\[ m \uparrow k \iff (f_{km}(1_t) - f_{km}(\bar{0})_t > 0), \text{ p.296.} \]

Intuitively, \( m \uparrow k \) means that \( m \) sees \( k \)'s clock running forwards. Further, if \( m, k \in \text{Obs} \) then \( m \text{ STL } k \) means that \( m \) sees \( k \) moving slower than light (cf. Def.4.2.6 on p.460).

\[ \text{Ax}(\uparrow) \quad (\forall m, m' \in \text{Obs}) \left( tr_m(m') = \bar{t} \Rightarrow m \uparrow m' \right), \text{ p.296.} \]

\[ \text{Ax}(\uparrow \uparrow) \quad (\forall m, k \in \text{Obs}) m \uparrow k, \text{ p.426.} \]

\[ \text{Ax}(\uparrow \uparrow_0) \quad (\forall m, k \in \text{Obs}) (m \overset{0}{\rightarrow} k \rightarrow m \uparrow k), \text{ p.840.} \]

\[ \text{Ax}(\uparrow \uparrow_{00}) \quad (\forall m, k \in \text{Obs}) (m \text{ STL } k \rightarrow m \uparrow k), \text{ p.840.} \]

(3) **Auxiliary axioms**

Recall that

\[ \text{Triv} = \{ f : f \text{ is an isometry of } ^nF \text{ and } f(1_t) - f(\bar{0}) = 1_t \}, \]

\( \text{cf. p.135.} \)

\[ \text{Ax}(\text{Triv}) \quad (\forall m \in \text{Obs})(\forall f \in \text{Triv})(\exists k \in \text{Obs}) f_{mk} = f, \text{ p.135.} \]

\[ \text{Ax}(\text{Triv}_i) \quad (\forall m \in \text{Obs})(\forall f \in \text{Triv}) \left( f[\bar{t}] = \bar{t} \Rightarrow (\exists k \in \text{Obs}) f_{mk} = f \right), \text{ p.135.} \]

\[ \text{Ax}(\text{Triv}_i^-) \quad \text{Assume we are given an observer } m \text{ and a } \text{Triv} \text{ transformation } f \text{ that leaves the time-axis fixed. Then } m \text{ has a brother, call it } k, \text{ such that } m \text{ thinks that (i) the coordinate axes of } k \text{ are the } f\text{-images of the original coordinate axes } \bar{x}_i, \text{ and (ii) the clock of } k \text{ runs forwards, formally:} \]

\[ (\forall m \in \text{Obs})(\forall f \in \text{Triv}) [ f[\bar{t}] = \bar{t} \Rightarrow (\exists k \in \text{Obs})(\forall i \in n)(f_{km}[\bar{x}_i] = f[\bar{x}_i] \land m \uparrow k)], \text{ p.812.} \]
\textbf{Ax(\textbf{||})} \quad (\forall m, k \in \text{Obs})(tr_m(k) \parallel \bar{t} \implies (f_{mk} \text{ is an isometry})), \text{p.136}.

\textbf{Ax(\textbf{||})}^{-} \quad (\forall m, k \in \text{Obs} \cap \text{Ib}) \quad 
\quad \quad [tr_m(k) = \bar{t} \implies (f_{mk} = h \circ I, \text{ for some expansion } h \text{ and isometry } I)], \text{p.828}.

\textbf{Ax(\sqrt{-})} \quad (\forall 0 < x \in F)(\exists y \in F) y^2 = x, \text{p.91}.

\textbf{Ax(rc)} \quad (\text{Axiom schema for real-closed fields})
\quad \quad \quad \textbf{Ax(\sqrt{-})} + \{ \phi_{2n+1} : n \in \omega \}, \text{where}
\quad \quad \quad (\phi_n) \quad \forall x_0 \ldots \forall x_n \exists y [x_n \neq 0 \implies (x_0 + x_1 \cdot y + \ldots + x_n \cdot y^n = 0)], \text{p.301}.

\textbf{Ax(disswind)} \quad (\text{Axiom of disjoint windows})
\quad \quad (\forall m, k \in \text{Obs} \cap \text{Ib}) [(m \overrightarrow{\circ} ph \land k \overrightarrow{\circ} ph) \implies m \overrightarrow{\circ} k], \text{p.812}.

(4) \textbf{Axioms concerning measuring distances}

\textbf{Ax(eqetime)} \quad \text{Observers with common life-line agree on time-like distances, i.e.}
\quad \quad (\forall m, m' \in \text{Obs}) 
\quad \quad \quad (tr_m(m') = \bar{t} \implies (\forall p, q \in \bar{t}) |p - q| = |f_{mm'}(p) - f_{mm'}(q)|), \text{p.127}.

\textbf{Ax(eqspace)} \quad \text{Observers agree on spatial distances, i.e.}
\quad \quad (\forall m, k \in \text{Obs})(\forall p, q \in \bar{n}F)
\quad \quad \quad (p = q \land f_{mk}(p) = f_{mk}(q) \implies |p - q| = |f_{mk}(p) - f_{mk}(q)|), \text{p.136}.

\textbf{Ax(eqm)} \quad \text{Inertial observers agree on distances, i.e.}
\quad \quad (\forall m, k \in \text{Obs} \cap \text{Ib})(\forall i, j \in n)(\forall p, q \in \bar{x}_i)(\forall p', q' \in \bar{x}_j)
\quad \quad \quad (|w_m(p) = w_k(p') \land w_m(q) = w_k(q')| \implies |p - q| = |p' - q'|), \text{p.796}.

1258
(5) Axiom systems $\text{Pax}^+, \text{Pax}^{++}, \text{Pax}_0^+, \text{Pax}_0^{++}, \text{Wax}, \text{Wax}^+$

$\text{Ax}(\text{Bw}) \ (\forall m,k \in \text{Obs})[m \xrightarrow{\circ} k \Rightarrow (f_{mk} \text{ is betweenness preserving})], \ p.1028.$

$\text{Ax} \bigcirc \ B = \text{Obs} \cup \text{Ph}, \ p.296.$

$\text{Ax}(\infty \text{ph}) \ (\forall m \in \text{Obs})(\forall \text{ph}, \text{ph'} \in \text{Ph}) \left( [\bar{0} \in \text{tr}_m(\text{ph}) \cap \text{tr}_m(\text{ph'}) \land \text{(ph and ph'} \right.$

move in the same direction as seen by $m) \land v_m(\text{ph}) = \infty] \rightarrow v_m(\text{ph'}) = \infty), \ p.1028.$

Intuitively, no observer can emit simultaneously in the same direction two photons one with infinite speed and the other one with finite speed.

$\text{Ax}(\text{ext}) \ (\forall m,k \in \text{Obs})[w_m = w_k \Rightarrow m = k] \land \left(\forall b,b_1 \in B \setminus \text{Obs} \right)^2 \ (\forall m \in \text{Obs}) \left[ \text{tr}_m(b) = \text{tr}_m(b_1) \Rightarrow b = b_1 \right], \ p.298.$

$\text{Ax}(\text{Ph}) \ (\forall m \in \text{Obs})(\forall \text{p} \in n F)(\exists \text{ph}_1, \text{ph}_2 \in \text{Ph}) \text{tr}_m(\text{ph}_1) \cap \text{tr}_m(\text{ph}_2) = \{p\}, \ p.1073.$

$\text{Pax}^+ \overset{\text{def}}{=} \text{Pax} + \text{AxE}_0 + \text{Ax}(\text{Bw}) + \text{Ax}(\infty \text{ph}) + \left( [\text{Ax(eqtime)} \land \left( \forall m,k \in \text{Obs} \right)^2 (\forall 0 < i \in \omega) \text{tr}_m(k) \neq \bar{x}_i] \lor \text{Ax(eq)} \right); \ p.1029.$

$\text{Pax}^{++} \overset{\text{def}}{=} \text{Pax}^+ + \text{Ax(eq)} + \text{Ax(eq)} + \text{Ax(eq)} + \text{Ax(eq)} + \text{Ax(eq)}; \ p.1081.$

$\text{Pax}_0^+ \overset{\text{def}}{=} \text{Pax}^+ + \text{Ax(diswind)}, \ p.1086.$

$\text{Pax}_0^{++} \overset{\text{def}}{=} \text{Pax}^{++} + \text{Ax(diswind)}, \ p.1093.$

$\text{Wax} \overset{\text{def}}{=} \{ \text{Ax1, Ax2, Ax3, Ax4, Ax6, Ax(Bw), Ax(Ph)} \}, \ p.1073.$

$\text{Wax}' \overset{\text{def}}{=} \text{Wax} + \text{Ax(eq)} + \text{Ax(eq)} + \text{Ax(eq)} + \left( \forall m,k \in \text{Aftr} \right); \ p.1081.$
(6) Symmetry axioms

**Ax(symm)***  $(\forall m, k \in \text{Obs})(\exists m', k' \in \text{Obs})$
\[ t_r(m') = t_r(k') = \bar{t} \land f_{mk} = f_{k'm'}, \] p.124.

Ax(symm) is defined to be **Ax(symm)*** + **Ax(eqtime)***, p.127.

**Ax(syt)*  $(\forall m, k \in \text{Obs}) (\forall p \in \bar{t})(\forall p \in \bar{t}) |f_{mk}(p) - f_{mk}(\bar{t})| = |f_{km}(p) - f_{km}(\bar{t})|, \] p.134.

**Ax(syt0)  $(\forall m, k \in \text{Obs}) |f_{mk}(\bar{t})| = |f_{km}(1_x)| = |f_{km}(1_x)|, \] p.721.

**Ax(eqtime)*  $(m, k \text{ are in pre-standard configuration}^{1300}) \Rightarrow |f_{mk}(1_x)| = |f_{km}(1_x)|, \] p.725.

**Ax(speedtime)**  $(\forall m, k, m', k' \in \text{Obs}) (v_m(k) = v_{m'}(k') \Rightarrow \forall p \in \bar{t}) |f_{mk}(p) - f_{mk}(\bar{t})| = |f_{m'k'}(p) - f_{m'k'}(\bar{t})|, \] p.137.

**Ax□1**  $(\forall m, k, m' \in \text{Obs})(\exists k' \in \text{Obs}) f_{mk} = f_{m'k'}, \] p.350.

**Ax□2**  $(\forall m, k, m', k' \in \text{Obs}) (t_r(m) = t_r(m') \Rightarrow \text{there is an isometry } N \text{ of } \mathbb{F} \text{ such that } N[\bar{t}] = \bar{t} \text{ and } f_{mk} = f_{m'k'} \circ N, \] p.350.

**Ax△1**  $(\forall m, k \in \text{Obs})(\exists k' \in \text{Obs}) (t_r(m) = t_r(k') \land f_{mk'} = f_{k'm}, \] p.351.

**Ax△2**  $(\forall m, k \in \text{Obs}) \text{ (there is an isometry } N \text{ of } \mathbb{F} \text{ such that } N[\bar{t}] = \bar{t} \text{ and } f_{mk} = N \circ f_{km} \circ N, \] p.351.

Ax($\omega$) is defined to be the disjunction of the following symmetry axioms:

- Ax(syt0), Ax(sym), Ax(speedtime), Ax△1+Ax(eqtime), Ax△2,
- Ax□1+Ax(eqtime), Ax□2, p.844.

Ax($\omega$) is defined to be the disjunction of the following symmetry axioms: Ax($\omega$),

Ax(eqspace), Ax(eqnum)+Ax(Triv)−, p.844.

Ax($\omega$) is defined to be Ax($\omega$)+Ax(Triv)−+Ax($\sqrt{-}$), p.844.

---

$^{1300}$m and k are said to be in *pre-standard configuration* iff $f_{mk}(\bar{t}) = \bar{t}$ and $f_{mk}[\text{Plane}(\bar{t}, \bar{x})] = \text{Plane}(\bar{t}, \bar{x})$. Cf. Def.4.6.5 (p.602) and Fig.201 (p.603).
\( \text{Ax}(\omega)^\oplus \) is defined to be \( \text{Ax}(\omega)^0 + \text{Ax}(\text{Triv}_1)^- + \text{Ax}(\sqrt{\_}), \) p.844.

\( \text{Ax}(\text{symm}) \uparrow \) is defined to be \( \text{Ax}(\text{symm}) + \text{Ax}(\text{Triv}) + \text{Ax}(|\_|), \) p.151.

\( \text{Ax}(\omega) \) \( \text{Ax}(\Box 1 \land \Box 2 \land \boxdot 1 \land \boxdot 2), \) p.351.

\( \text{Ax}(\omega^-) \) \( \text{Ax}(\Box 1 \lor \Box 2 \lor \boxdot 1 \lor \boxdot 2), \) p.351.

(7) Symmetry axioms adequate for Reichenbachian theories

\( \mathbf{R}^+(\text{Ax eqsp}) \) Intuitively, the thickness of spaceships do not change in the direction orthogonal to movement (cf. pp. 608–614), formally:

Assume \( m, k \in \text{Obs} \) such that \( m \lnot\rightarrow k. \) Assume \( P, Q \) are parallel planes of \( nF \) such that they are parallel with both \( \vec{t} \) and \( tr_m(k). \) Then

\[
\text{Eudist}(P, Q) = \text{Eudist}(f_{mk}[P], f_{mk}[Q]), \quad \text{p.614, where}
\]

\[
\text{Eudist}(H, H_1) \overset{\text{def}}{=} \inf \{ \| p - q \| : p \in H \text{ and } q \in H_1 \}.
\]

\( \mathbf{R}(\text{Ax eqsp}) \) Intuitively, the thickness of spaceships do not change in the direction orthogonal to movement (cf. pp. 608–614), formally:

Assume \( m \) and \( k \) are in pre-standard configuration\(^{1301}\). Let \( P \) be a (2-dimensional) plane parallel with \( \text{Plane}(\vec{t}, \vec{x}) \). Then the distance between \( P \) and \( \text{Plane}(\vec{t}, \vec{x}) \) is the same as the distance between \( f_{mk}[P] \) and \( f_{mk}[\text{Plane}(\vec{t}, \vec{x})] \).

Formally,

\[
\text{Eudist}(P, \text{Plane}(\vec{t}, \vec{x})) = \text{Eudist}(f_{mk}[P], f_{mk}[\text{Plane}(\vec{t}, \vec{x})]), \quad \text{p.611, where}
\]

\[
\text{Eudist}(H, H_1) \overset{\text{def}}{=} \inf \{ \| p - q \| : p \in H \text{ and } q \in H_1 \}, \quad \text{cf. p.609.}
\]

See Fig.205 on p.611.

\( \mathbf{R}(\text{Ax syto}) \) Intuitively \( m \) and \( k \) literally see, via photons, each other’s clocks slowing down with the same rate, see Fig.207 (p.616), formally:

\[ (\forall m, k \in \text{Obs}) f_{mk}(\vec{0}) = \vec{0} \Rightarrow (\forall p \in \vec{t}) |\text{view}_m(f_{km}(p))| = |\text{view}_k(f_{mk}(p))| \] (cf. p.615),

where \( \text{view}_m \overset{\text{def}}{=} \{ \langle p, q \rangle \in nF \times \vec{t} : p_i \leq q_i \text{ and } (\exists ph \in Ph) p, q \in tr_m(ph) \}, \) cf. Fig.206 (p.615).

\( \mathbf{R}(\text{sym}) \) is defined to be \( \mathbf{R}(\text{Ax eqsp}) + \mathbf{R}(\text{Ax syto}), \) p.616.

\(^{1301}\)Cf. footnote 1300 on p.1260 for the notion of a pre-standard configuration.
(8) Twin paradox

Let \( m, k \in \text{Obs} \). Then \( m \text{ STL } k \) means that \( m \) sees \( k \) moving slower than light, cf. Def.4.2.6 on p.460 for details.

\[ \text{Ax(TwP)} \quad (\forall m, k_1, k_2 \in \text{Obs})(\forall p, q, r \in \mathbb{N}F) \]

\[ \big( m \text{ STL } k_1 \wedge m \text{ STL } k_2 \wedge p_t < q_t < r_t \wedge \{ p \} = \text{tr}_m(m) \cap \text{tr}_m(k_1) \wedge \{ q \} = \text{tr}_m(k_1) \cap \text{tr}_m(k_2) \wedge \{ r \} = \text{tr}_m(m) \cap \text{tr}_m(k_2) \big) \Rightarrow \]

\[ |p_t - r_t| > |f_{mk_1}(p)_t - f_{mk_1}(q)_t| + |f_{mk_2}(q)_t - f_{mk_2}(r)_t| \text{, p.460} \]

(cf. Fig.43 on p.141).

The existential version \( \text{Ax(∃TwP)} \) of the twin paradox is defined as follows. First, let us notice that \( \text{Ax(TwP)} \) is a formula of the pattern

\[ (\forall m \ldots)(\forall p \ldots)(\ldots) \Rightarrow \ldots > \ldots \].

Let \( \psi_1, \psi_2 \) be formulas such that \( \text{Ax(TwP)} \) is the formula

\[ (\forall m, k_1, k_2 \in \text{Obs})(\exists p, q, r \in \mathbb{N}F)(\psi_1 \Rightarrow \psi_2) \text{.} \]

Now we define \( \text{Ax(∃TwP)} \) as follows.

\[ \text{Ax(∃TwP)} \quad (\exists m, k_1, k_2 \in \text{Obs})(\exists p, q, r \in \mathbb{N}F)[\psi_1 \land \psi_2], \text{p.461} \]

(9) Axiom systems Specrel, Flxspecrel, BaCo, Compl, NewtK\(^-\), NewtK

\[ \text{Specrel} \overset{\text{def}}{=} \text{Basax} + \text{Ax(symm)}^\dagger, \text{p.151}. \]

\[ \text{Flxspecrel} \overset{\text{def}}{=} \text{Bax} + \text{Ax6} + \text{Ax(symm)}^\dagger + \text{AxE}_{02}, \text{p.428}. \]

\[ \text{Compl} \overset{\text{def}}{=} \{ \text{Ax(symm)}, \text{Ax} \heartsuit, \text{Ax}(\uparrow), \text{Ax}^5, \text{Ax(ext)}, \text{Ax(Triv)} \} \text{ (cf. p.298),} \]

where

\[ \text{Ax}^5 \quad \ell \in \text{SlowEucl} \Rightarrow (\exists k \in \text{Obs})(\ell = \text{tr}_m(k) \wedge m \uparrow k), \text{p.297}. \]

\[ \text{BaCo} \overset{\text{def}}{=} \text{Basax} + \text{Compl}, \text{p.298}. \]

\[ \text{NewtK}^- \overset{\text{def}}{=} \text{Bax} + \text{Ax6} + \text{Ax(symm)}^\dagger + (\forall m \in \text{Obs})c_m = \infty \text{ (cf. p.426), where} \]

\( c_m \) is the speed of light for observer \( m \), assuming \( \text{Bax} \).

\[ \text{NewtK} \overset{\text{def}}{=} \text{NewtK}^- + \text{Ax}(\uparrow\uparrow) + \text{Ax□1}, \text{p.426}. \]

1262
(10) Geometrical axioms and axiom systems

Axioms $A_0 - A_4$ and $P_1$, $P_2$, $Pa$ below apply to geometries with reducts $\langle Mn; Bw \rangle$ or $\langle Mn; coll \rangle$. In the case of $\langle Mn; Bw \rangle$ coll is a defined relation, cf. p.818. The new universe (or sort) lines is (explicitly) defined over $\langle Mn; coll \rangle$ on p.1037. For $H \subseteq Mn$, Plane$^r(H)$ is intuitively the “n-long closure of $H$ under coll” (cf. Def.6.2.15 on p.819), where throughout $n$ is the dimension of our geometry and $n \geq 2$.

$A_0$ $(\forall a, b, c \in Mn)[coll(a, b, c) \leftrightarrow (\exists \ell \in lines) a, b, c \in \ell]$, p.1038.

$A_1$ $(\forall a, b \in Mn)(a \neq b \rightarrow (\exists! \ell \in lines) a, b \in \ell)$, p.1038.

$A_2$ Intuitively, if $H$ is a less than $n + 2$ element subset of $Mn$ then the “n-long closure” Plane$^r(H)$ of $H$ under coll will be closed under coll, hence the plane Plane$(H)$ generated by $H$ coincides with Plane$^r(H)$ (cf. Def.6.2.15, p.819), formally:

$$(\forall H \subseteq Mn) \left( (\|H\| \leq n + 1 \wedge a, b \in Plane^r(H) \wedge coll(a, b, c)) \rightarrow c \in Plane^r(H) \right)$$

p.1039.

$A_3$ Intuitively, if $i \leq n$ and $H$ is an $i + 1$ element independent subset$^{1302}$ of $Mn$ then there is exactly one $i$-dimensional plane$^{1303}$ that contains $H$, formally:

$$(\forall H, H' \subseteq Mn) \left( (\|H\| = |H'| \leq n + 1 \wedge (\text{both } H \text{ and } H' \text{ are independent}) \wedge H \subseteq Plane^r(H') \rightarrow Plane^r(H) = Plane^r(H') \right)$$

p.1039.

$A_4$ Mn is an $n$ dimensional plane, p.1039.

In connection with axioms $P_1$, $P_2$ below we note that the relation of parallelism $\| \|$ on lines is defined the usual way in Def.6.6.19 on p.1039.

$P_1$ (Euclid’s axiom)

$$(\forall \ell \in lines)(\forall a \in Mn)(\exists! \ell' \in lines)(a \in \ell \wedge \ell \| \ell')$$

p.1040.

$P_2$ $(\ell \parallel \ell' \wedge \ell \parallel \ell'') \rightarrow \ell \parallel \ell''$, p.1040.

$^{1302}$Let $H \subseteq Mn$. $H$ is called independent iff $(\forall e \in H) e \not\in Plane^r(H \setminus \{e\})$, cf. p.1039.

$^{1303}$Let $P \subseteq Mn$. $P$ is called an $i$-dimensional iff there is an $i + 1$ element independent subset $H$ of $Mn$ such that Plane$^r(H) = P$, where for the notion of an independent subset cf. footnote 1302. Cf. Def.6.6.18(ii) on p.1039.
\[ \text{ag} \overset{\text{def}}{=} \{A_0, A_1, A_2, A_3, A_4, P_1, P_2\}, \] p.1040. \text{ag} is the axiom system for \textit{affine geometries}.

For \(a, b, c, d \in M_n\), the abbreviation \(\langle a, b \rangle \parallel \langle c, d \rangle\) means that \(a \neq b, c \neq d\), and there are \(\ell, \ell' \in \text{lines}\) such that \(a, b \in \ell, c, d \in \ell'\) and \(\ell \parallel \ell'\), cf. p.1042.

\textbf{Pa} (Pappus-Pascal property)
\[
(\forall \ell, \ell' \in \text{lines})(\forall a, b, c \in \ell \setminus \ell')(\forall a', b', c' \in \ell' \setminus \ell')
\]
\[
[ (\langle a, b' \rangle \parallel \langle a', b \rangle \wedge \langle a, c' \rangle \parallel \langle a', c \rangle ) \rightarrow \langle b, c' \rangle \parallel \langle b', c \rangle ],
\]
see Fig.319, p.1042.

\[ \text{pag} \overset{\text{def}}{=} \text{ag} + \text{Pa}, \] p.1042. \text{pag} is the axiom system for \textit{Pappian affine geometries}.

Axioms \(B_1-B_3\) below apply to geometries with reducts \(\langle M_n; Bw \rangle\). (\text{coll} is a defined relation.)

\(B_1\) \(Bw(a, b, c) \rightarrow (a \neq b \neq c \neq a \wedge Bw(c, b, a) \wedge \neg Bw(b, a, c))\), p.1043.

\(B_2\) \(a \neq b \rightarrow (\exists c)Bw(a, b, c)\), p.1043.

\(B_3\) (Pasch’s Law)

Intuitively, if a line \(\ell\) lies in the plane determined by a triangle \(abc\), and passes between \(a\) and \(b\) but not through \(c\), then \(\ell\) passes between \(a\) and \(c\), or between \(b\) and \(c\), formally:

\[
(\neg \text{coll}(a, b, c) \wedge \ell \subseteq \text{Plane}'(\{a, b, c\}) \wedge (\exists d \in \ell)Bw(a, d, b) ) \rightarrow \\
(\exists e \in \ell)(Bw(a, e, c) \lor Bw(b, e, c)), \] p.1043 (cf. Fig.320 on p.1044).

\[ \text{opag} \overset{\text{def}}{=} \text{pag} + \{B_1, B_2, B_3\}, \] p.1044. \text{opag} is the axiom system for \textit{ordered Pappian affine geometries}.

Axioms \(L_1, \ldots, L_{10}\) below apply to geometries with reducts

\[ \langle M_n, L; L^T, L^p, L^s, \in, <, Bw, \bot_r, eq \rangle. \]

Further, \text{coll} is a defined relation and it is defined over \(\langle M_n; Bw \rangle\), cf. p.818, and \textit{lines} is the new sort firts-order defined from \text{coll}.

\(L_1\) \(L \subseteq \text{lines}, \) p.1071.
\( L_2 \ (\forall a \in Mn)(\exists \ell, \ell' \in L^p) \ell \cap \ell' = \{a\} \), p.1071.

\[
\lopag \overset{\text{def}}{=} \opag + L_1 + L_2, \text{ p.1071.}
\]

\( L_3 \ (\begin{array}{c}
( a \prec b \land (Bw(a, b, c) \lor Bw(a, c, b)) \rightarrow a \prec c) \land \\
( a \prec b \land (Bw(c, a, b) \lor Bw(a, c, b))) \rightarrow c \prec b
\end{array}) \), p.1076.

\( L_4 \) Intuitively, eq is (very) symmetric, formally:
\[
\langle a, b \rangle \ \text{eq} \ \langle c, d \rangle \rightarrow (\langle c, d \rangle \ \text{eq} \ \langle a, b \rangle \land \langle b, a \rangle \ \text{eq} \ \langle c, d \rangle \land \langle a, a \rangle \ \text{eq} \ \langle c, c \rangle), \text{ p.1076.}
\]

\( L_5 \) eq is transitive, i.e.
\[
(\langle a, b \rangle \ \text{eq} \ \langle c, d \rangle \land \langle c, d \rangle \ \text{eq} \ \langle e, f \rangle) \rightarrow \langle a, b \rangle \ \text{eq} \ \langle e, f \rangle, \text{ p.1076.}
\]

\( L_6 \) (For the intuitive meaning of this axiom see Fig.326 on p.1076.)
\[
(\forall \ell, \ell' \in L)(\forall o, e, e', a, a' \in Mn)\left(\begin{array}{c}
( a \in \ell \land e \in \ell \land e', a' \in \ell' \land \\
\langle e, e' \rangle \parallel \langle a, a' \rangle \land \langle a, e \rangle \ \text{eq} \ \langle a, e' \rangle
\end{array}\right) \rightarrow \langle a, a \rangle \ \text{eq} \ \langle a, a' \rangle, \text{ p.1076.}
\]

\( L_7 \) (For the intuitive meaning of this axiom see Fig.327 on p.1077.)
\[
(\forall \ell \in L^p \cup L^S)(\forall a, b, c, d, e, f \in Mn)\left(\begin{array}{c}
( a \in \ell \land e \in \ell \land e, f \in \ell \land \\
\langle a, b \rangle \parallel \langle e, f \rangle \parallel \langle c, d \rangle \land \langle a, e \rangle \parallel \langle b, f \rangle \land \langle c, e \rangle \parallel \langle d, f \rangle
\end{array}\right) \rightarrow \langle a, b \rangle \ \text{eq} \ \langle c, d \rangle, \text{ p.1076.}
\]

\( L_8 \) \( \perp_r \) is symmetric, i.e.
\[
(\forall \ell, \ell' \in L)(\perp_r \ell \land \ell' \rightarrow \perp_r \ell), \text{ p.1076.}
\]

\( L_9 \) \( \perp_r \) is closed under parallelism, i.e.
\[
(\forall \ell, \ell_1, \ell_2 \in L)(\perp_r \ell \land \ell_1 \parallel \ell_2 \rightarrow \ell \perp_r \ell_2), \text{ p.1076.}
\]

\( L_{10} \) \( \perp_r \) is closed under taking limits, p.1077.

\[
\lopag^+ \overset{\text{def}}{=} \lopag + L_3 + L_4 + L_5 + L_6 + L_7 + L_8 + L_9 + L_{10}, \text{ p.1081}
\]
(11) “Speed of light free” axiom systems for relativity
(axioms and axiom systems used in Chapter 5)

\[ \text{Relnoph}_0 \overset{\text{def}}{=} (\text{Ax1} - \text{Ax4})^{1304} + \text{Ax6} + \text{Ax} \Box 1 + \text{Ax} \Delta 1 + \text{Ax}(\sqrt{\cdot}) + \text{Ax}(\text{Triv}) + \text{Ax}(\|), \text{p.705.} \]

\[ \text{Ax(5nop)} \ \forall m, k \ (\forall \lambda \in F)[\lambda < v_m(k) \ \Rightarrow \ \exists k' (v_m(k') = \lambda)], \text{p.706.} \]

The intuitive idea of \text{Ax(5nop)} is that if a certain speed is realized by some observer then the smaller speeds are also realized by some observers.

\[ \text{Relnoph} \overset{\text{def}}{=} \text{Relnoph}_0 + \text{Ax(5nop)}, \text{p.707.} \]

\[ \text{Ax(group}^+\) \ (\forall m, k, m', k' \in \text{Obs}) (\exists k'' \in \text{Obs}) f_{mk} \circ f_{m'k'} = f_{mk''}, \text{p.410.} \]

\[ \text{Ax(syt)*} \ f_{mk}(0) = 0 \ \Rightarrow \ f_{mk}(1)_t = f_{km}(1)_t, \text{p.721.} \]

\[ \text{Ax(syx)*} \ (m, k \text{ are in pre-standard configuration})^{1305} \ \Rightarrow \ |f_{mk}(1)_x| = |f_{km}(1)_x|, \text{p.725.} \]

(*1)–(*3) below are also potential axioms\textsuperscript{1306} (or principles) connected with \text{Relnoph}.

\[ (\ast 1) \text{ The sum of finitely many small positive velocities is not infinite, formally: Let } j \in \omega. \text{ Let } m_0, \ldots, m_j \in \text{Obs. Assume } m_i, m_{i+1} \text{ are in strict standard configuration}\textsuperscript{1307} \text{ and } v_{m_i}(m_{i+1}) < 1, \text{ for all } i < j. \text{ Then } v_{m_0}(m_j) \neq \infty, \text{p.710.} \]

\[ (\ast 2) \text{ The sum of finitely many small positive velocities is nonnegative, formally: Let } j \in \omega. \text{ Let } m_0, \ldots, m_j \in \text{Obs. Assume } m_i, m_{i+1} \text{ are in strict standard configuration and } v_{m_i}(m_{i+1}) < 1, \text{ for all } i < j. \text{ Then } m_0 \text{ sees } m_j \text{ moving forwards in direction } 1_x, \text{p.710.} \]

\textsuperscript{1304} \text{Ax1, Ax2, Ax3, Ax4.}

\textsuperscript{1305} \text{Cf. footnote 1300 on p.1260 for the notion of a pre-standard configuration.}

\textsuperscript{1306} (\ast 1)–(\ast 3) are schemas of formulas.

\textsuperscript{1307} \text{Assume } m, k \in \text{Obs. Then } m \text{ and } k \text{ are defined to be in strict standard configuration if they are in standard configuration, } m \text{ sees } k \text{ moving forwards in direction } 1_x, k \text{ sees } m \text{ moving backwards in direction } 1_x, \text{ further } [v_m(k) = 0 \Rightarrow f_{km}(1)_t \cdot f_{km}(1)_x > 0] \text{ and } [v_m(k) = \infty \Rightarrow (f_{km}(1)_x > 0 \& f_{km}(1)_x < 0)]. \text{ Cf. Def.5.0.42 (p.709) and Remark 5.0.43 (p.709).}
The sum of finitely many small positive velocities is nonzero, formally: Let $0 < j < \omega$. Let $m_0, \ldots, m_j \in \text{Obs}$. Assume $m_i, m_{i+1}$ are in strict standard configuration and $0 < v_{m_i}(m_{i+1}) < 1$, for all $i < j$. Then $v_{m_0}(m_j) \neq 0$, p.710.

“Flxspecrel”, the notation $\mathfrak{M} \models \text{“Flxspecrel”}”$ was introduced on p.708.

$\text{Ax(natu)}$ \quad $(*1) \lor (*2) \lor (*3)$,\textsuperscript{1308} p.752

$\text{Ax(natu)}^+$ \quad $(\forall m, k, k' \in \text{Obs}) \sqrt{v_m(k')} \leq \sqrt{v_m(k)} + \sqrt{v_{k'}(k')}$, p.753.

$\text{Ax(3body)}$ \quad $(\forall m, k (\forall \ell \in \text{Euc})[(v_m(k) > 0 \land f_{mk}[\ell] = \ell) \Rightarrow (\exists b \in B)tr_m(b) = \ell]$, p.757.

$\text{Ax(5nop)}^- \quad \forall m (\exists c \in +F)(\forall \lambda \in +F)[\lambda < c \Rightarrow (\exists k)v_m(k) = \lambda]$, p.761.

$\mathbf{Relnoph}^-$ is obtained from $\mathbf{Relnoph}$ by replacing $\text{Ax(5nop)}$ with $\text{Ax(5nop)}^-$, p.761.

$\text{Bax}^-_{nobs} \overset{\text{def}}{=} \text{Bax}^- \setminus \{\text{Ax5obs}\} + \text{Ax(5nop)}^-$, p.762.

$\mathbf{Relnoph}^-_{\forall} \overset{\text{def}}{=} \mathbf{Relnoph}^- \setminus \{\text{Ax}\triangle 1\} + \text{Ax(symp)}$, p.764.

(12) The cone-smooth versions of our theories

Assume $\text{Ax1}$, $\text{Ax2}$, $\text{Ax3}_0$, $\text{AxP1}$. Let $m \in \text{Obs}$. Then

$$c_m : ^mF \times \text{directions} \rightarrow F \cup \{\infty\}$$

is a partial function such that $c_m(p,d)$ is defined iff $m$ sees a photon at point $p$ moving forwards in direction $d$, and $c_m(p,d)$ is the speed of this photon,\textsuperscript{1309} cf. pp. 473, 535. Further, for any $m \in \text{Obs}$ and $d \in \text{directions}$

$$c_m(d) \overset{\text{def}}{=} c_m(0,d),$$

\textsuperscript{1308}$\text{Ax(natu)}$ is a schema of formulas.

\textsuperscript{1309}There is only one such speed because of $\text{AxP1}$.  

1267
cf. p.488. Hence, \( c_m : \text{directions} \rightarrow F \cup \{ \infty \} \) is a partial function. \((\text{Ax}(\text{consm})\) below will imply that it is not partial. The notion of strongly continuous functions, partial derivatives etc. used in \( \text{Ax}(\text{consm})\) below are formulated in our frame language on pp. 536, 518.) Now,

\[
\text{Ax}(\text{consm}) \overset{\text{def}}{=} \text{Ax}(\text{cnsm}_0) + \text{Ax}(\text{cnsm}_1) + \text{Ax}(\text{cnsm}_2) \quad \text{(cf. p.518), where}
\]

\( \text{Ax}(\text{cnsm}_0) \) \( c_m \) is a strongly continuous function defined on directions, p.519.

\( \text{Ax}(\text{cnsm}_1) \) For all \( 0 < i < n \), the partial derivative \( (\partial_i c_m) : \text{directions} \rightarrow F \) is everywhere defined on the domain \( \text{directions} \), p.519.

\( \text{Ax}(\text{cnsm}_2) \) For all \( 0 < i < n \), \( \partial_i c_m \) is strongly continuous on the domain \( \text{directions} \), p.519.

Let \( Th \) be one of our theories such that \( Th \models \{ \text{Ax}1, \text{Ax}2, \text{Ax}3_0, \text{Ax}P1 \} \). Then

\[
[Th_{\text{cnsm}}] \overset{\text{def}}{=} Th + \text{Ax}(\text{consm})
\]

is called the \textit{cone-smooth version} of the theory \( Th \), cf. p.521.

(13) Axioms and axiom systems not listed in this list

\( \text{Ax}_{\text{oF}}, \) p.30.
\( \text{Ax}_c, \) p.31. (\( \text{Ax}_{\text{oF}} \) and \( \text{Ax}_c \) are assumed throughout the present work.)

Credits

Figures 258, 261, 333 are created from works by M. C. Escher, which appeared in D. R. Hofstadter: "Gödel, Escher, Bach", Hungarian translation, Typotex Kiadó, 1998. Figure 355 (representing Gödel’s rotating universe) and Figure 290 are created from figures in S. W. Hawking and G. F. R. Ellis [126]. Figure 281 (view from near a black hole) is created from a figure in K. S. Thorne [258].

one-sorted vector space, 42
one-way speed of light, 553
open interval, $\text{int}(p,q)$, 509
open set of a topology, 870
ordered field, 30, 43
ordered field corresponding to an ordered Pappian affine geometry, 1049
ordered field reduct of a frame model, 30, 43
ordered Pappian affine geometry, 1044
orthogonal, 172
orthogonal in the Euclidean sense, 172
orthogonality $(\perp_r, \perp)$, a relation of an observer-independent (or a relativistic) geometry, 790
orthogonality, Minkowskian $(\perp_\mu)$, 860
orthogonality, relativistic, 790
P1, 522
P2, 522
P3, 522
Pappian affine geometry, 1042
Pappus-Pascal Property, 1041
paradigmatic effects, 90, 491, 635
paradigmatic theorems, 90
parallel lines, 1039
parallel lines ($\ell \parallel \ell_1$) in an observer-independent (or in a relativistic) geometry, 790
parallel straight lines, 164
parallelogram, 167
parameterization, 1180
parametrizable curve, 1180
parsimonious version of a theory, 465
partial derivative, $\partial_k f$, 518
partial function, 517
parts of SPR, 349
Pasch’s Law, 1043
periodical body, 1117
photon-disjoint unions of frame models, 869
photon-free reduct of a frame model, 708
photon-free sub-reduct of a frame model, 708
photon-glued disjoint unions of geometries, 873, 874
photon-glued disjoint unions of non-disjoint geometries, 874
photon-like Archimedean geodesic, 1179
photon-like geodesic, 1179
photon-like lines, $L^\text{ph}$, 788
photon-like quasi geodesic, 1179
photon-like separated events, $e \equiv^{\text{ph}}_e c_2$, 799
photon-line, 58
photon-preserving affine transformations, 265
photon-preserving transformation, 62
photon-sphere, $\mathcal{C}_m$, 505
photons, 31
plane, 164
plane generated by a set of points of a
relativistic geometry, 819
plane tangent to a light-cone in a
relativistic geometry, cf. footnote 799 on p, 857
Poincaré Group, 408
Poincaré transformation, 153, 728
Points = Mn
cf. footnote 958 on p, 991
points (Mn) of an observer-independent geometry, 787
points of a topology, 870
poset, 451, 1097
potential laws (of nature), 777, 778, 1107
pre-standard configuration, 602
pre-standard symmetric configuration, 603
pre-standard-sym configuration, 603
prime ideal, cf. footnote 1002 on p, 1015
principle of absolute space, 438
principle of absolute time, 437
principle of isotropy, 219
principle of parsimony, 123, 464, 775
principles (*1), (*2), (*3), 710
projection functions, 947
pseudo-metric reduct of a relativistic
gometry, 1179
pseudo-metric, g, 797
quantities, 29
quasi geodesic, 1181
quasi-standard configuration, 605
quasi-standard-sym configuration, 605
rank of a relation symbol, 931
real-closed field, 301
reduct, 30
reduct of a class of models, 932
reduct of a model, 930, 932
reference frames, 54
reflection, 1090, 1091
reflection arrow, 1091
reflection w.r.t. a line, 173
Reichenbach, 774, 775, 777, 781
Reichenbach-adequate, 608
Reichenbachian version of a theory, 562
Reichenbachian version of
the observer-independent ge-
ometry, 799
Reichenbachizing a theory, 563
relation of connectedness, ∼, 818, 894
relative space-time, 470
relativistic addition of velocities, 420
relativistic effect, 491
relativistic geometry, 798
relativistic orthogonalities, ⊥r, ⊥r (al-
ternatives for ⊥r), 810
relativistic orthogonalities, ⊥r, ⊥r
(alternatives for ⊥r), 821
relativistic orthogonality, ⊥r, ⊥, 790,
792
relativity based on Einstein’s SPR only
(i.e. not mentioning speed of
light), 704
relativity without any connection with
electrodynamics, 704
relativized model, 569
relativized models of a theory, 570
relativizing with artificial simultane-
ities, 569
representation theorems, 1106
residuated-residual pair, 1097
rhombus, 172
rhombus transformation, 72

1288
rigidly definable, 951
Robb hyper-plane, 804, 1130
Robb plane, 1163
Robb’s “after”, 1156
rotating observers, 554
rotation model, 729
rotation, cf. footnote 584 on p, 729
round-trip of photons, 553

segment, 166
semantical, 581
sentence, see footnote 954 on p, 987
short geodesic, 1182
short space-like geodesic, 1182
short time-like geodesic, 1180
similar algebraic structures, cf. footnote 167 p, 161
similar models, 932
similar models, cf. footnote 167 p, 161
similar structures, 798
similarity type, 27
simple models, 249
simplifying principles part of a theory, 465
simultaneity-stable, 578
simultaneous events, 95
slow observer, 483
slow-line, 58
space component, 32, 43
space coordinates, 43
space location, 32
space part, 54
space part of the coordinate-system, 208
space-axes, 470
space-like Archimedean geodesic, 1181
space-like geodesic, 1181
space-like hyper-plane in a relativistic geometry, 1130
space-like lines, $L^S$, 788
space-like quasi geodesic, 1180
space-like separated events, 799
space-part, $S$, 470
space-time, 33, 470, 788, 802
space-time location, 32
spaceships shrink, 90, 100
spatial direction, 470
special case of an axiom system or a theory, cf. footnote ?? p, 423
special relativity with no photons, 704
speed, 47
speed of a body in a direction, 534
speed of light axiom, 564
speed of light axioms, 555
speed of light is finite, 491
SPR, 123, 347, 454, 523
SPR0, 523
square of generalized Minkowski distance, 728
standard configuration, 71
Standard Lorentz Group, 408
standard Lorentz transformation, 152
standard model of $\textbf{Reich}_0(Th)$, 570
standard models of a Reichenbachian theory, 570
Stone, 786, 1015, 1019
Stone duality theory, 1015, 1019
Stone representation theorem, cf. also
Stone duality theory, 786
straight line, 45
streamlined partial metric = time-like-metric, 1169
streamlined partial metric reduct of $\mathfrak{G}_3$, 1170
strict standard configuration, 71, 709
strict standard world-view transformation, 709
strong embedding, 1085
strong geodesic, 1182
strong submodel, 161
cf. footnote 983 on p, 1008
strong substructure, cf. strong submodel, 161
strongly continuous, 537
strongly non-inertial body, 1119
sub-vector space, cf. footnote 166 on p, 160
sub-vocabulary, 932
subalgebra, 160
subbase for a topology, cf. footnote 1004 on p, 1016
subcategory, 1090
submodel, 161
subspace, cf. footnote 166 on p, 160
substructure, 161
sum of topologies = coproduct of topologies, 870
sum topology, cf. footnote 766 p, 841
supremum, 451
surface, 594
symmetric version of Reich(Basax), 627
symmetric version of a theory, 454, 455
symmetry, 347
symmetry axioms, 123, 844, 910, 913, 1107
symmetry principle, 454, 455, 777
symmetry principle part of a theory, 454
synchronism, 90
syntactical, 581
syntax-semantics duality, 453, 1020
(syntax, semantics)-duality, 1020
synthetic geometry = “axiomatic geometry”, 1106
T₂ (i.e. Hausdorff) space, cf. footnote 1009 on p, 1018
T₀-space, T₀ topological space, cf. footnote 1006 on p, 1017
taking limits, 791
terminology of universal algebra, 160, 161
theorem-schemas (A)–(i) for duality theories, 1012
theoretical, 774
theory, 299
theory generated by an axiom system, 1027, 1111
theory morphisms, 1025
three-sorted first-order language = 3-sorted first-order language, 27
three-way speed of light, 572
time axis, 43
time component, 32, 43
time coordinate, 43
time-axis, 470
time-like Archimedean geodesic, 1181
time-like geodesic, 1181
time-like hyper-plane in a relativistic geometry, 1130
time-like lines, L⁺, 788
time-like quasi geodesic, 1180
time-like separated events, e ≡⁺ e₁, 799
time-like-metric g⁻, 1169
time-like-metric geometry, 1170
time-like-metric reduct of a relativistic geometry, 1170
time-like-metric relativistic geometry, 1170
time-like-metric structure, 1170
time-part, t, 470
topology generated by ..., see footnote 672 on p, 797
topological space, 870
topology \((\mathcal{T})\) of an observer-independent (or a relativistic) geometry, 797

trace, 47
transformation, 62
translation, 152
twin paradox, 38, 140, 460
two-dimensional plane in a relativistic geometry, see footnote 798 on p, 857
two-sorted vector space, 42
two-way speed of light, 553
type A transformations, 751
type B transformations, 751
type C transformations, 751
types A, B, C, 751

ultrapower, 1139
uniform (explicit) definability, 951
uniform implicit definition, 937
uniformly definable, 937
unions of geometries and models, 868
unit vector, 69
universal algebra, 160, 161, 298
universes of a three-sorted model, 33

vector, 38
vector space, 42
velocities add up, 437
velocity, 48
velocity structure, 420
velocity-equivalence, 421
visibility relation, 192
vocabulary, 27, 931, 962
vocabulary of a model, 931

weak geodesic, 1183
Weak Principle of Isotropy, 219
weak submodel, 1008
weakly definitionally equivalent, 986

weakly standard configuration, 416
why-type questions, 469
window, 876
witness to \(eq^S_0\), 902
witness to \(eq_0\), 899
work (configurations work), 604
world-view, 52
world-view function, 32
world-view relation, 32
world-view transformation, 56, 913–915
world-view transformation of nonzero speed, 709
world-view transformations of types A, B, C, 751

WPI, 219
